

A sustainable bioenergy policy for the period after 2020

Fields marked with * are mandatory.

Introduction

EU Member States have agreed on a new policy framework for climate and energy, including EU-wide targets for the period between 2020 and 2030. The targets include reducing the Union's greenhouse gas (GHG) emissions by 40 % relative to emissions in 2005 and ensuring that at least 27 % of the EU's energy comes from renewable sources. They should help to make the EU's energy system more competitive, secure and sustainable, and help it meet its long-term (2050) GHG reductions target.

In January 2014, in its Communication on A policy framework for climate and energy in the period from 2020 to 2030,[1] the Commission stated that '[a]n improved biomass policy will also be necessary to maximise the resource-efficient use of biomass in order to deliver robust and verifiable greenhouse gas savings and to allow for fair competition between the various uses of biomass resources in the construction sector, paper and pulp industries and biochemical and energy production. This should also encompass the sustainable use of land, the sustainable management of forests in line with the EU's forest strategy and address indirect land-use effects as with biofuels'.

In 2015, in its Energy Union strategy,[2] the Commission announced that it would come forward with an updated bioenergy sustainability policy, as part of a renewable energy package for the period after 2020.

Bioenergy is the form of renewable energy used most in the EU and it is expected to continue to make up a significant part of the overall energy mix in the future. On the other hand, concerns have been raised about the sustainability impacts and competition for resources stemming from the increasing reliance on bioenergy production and use.

Currently, the Renewable Energy Directive[3] and the Fuel Quality Directive[4] provide an EU-level sustainability framework for biofuels[5] and bioliquids.[6] This includes harmonised sustainability criteria for biofuels and provisions aimed at limiting indirect land-use change,[7] which were introduced in 2015.[8]

In 2010, the Commission issued a Recommendation[9] that included non-binding sustainability criteria for solid and gaseous biomass used for electricity, heating and cooling (applicable to installations with a capacity of over 1 MW). Sustainability schemes have also been developed in a number of Member States.

The Commission is now reviewing the sustainability of all bioenergy sources and final uses for the period after 2020. Identified sustainability risks under examination include lifecycle greenhouse gas emissions from bioenergy production and use; impacts on the carbon stock of forests and other ecosystems; impacts on biodiversity, soil and water, and emissions to the air; indirect land use change impacts; as well as impacts on the competition for the use of biomass between different sectors (energy, industrial uses, food). The Commission has carried out a number of studies to examine these issues more in detail.

The development of bioenergy also needs to be seen in the wider context of a number of priorities for the Energy Union, including the ambition for the Union to become the world leader in renewable energy, to lead the fight against global warming, to ensure security of supply and integrated and efficient energy markets, as well as broader EU objectives such as reinforcing Europe's industrial base, stimulating research and innovation and promoting competitiveness and job creation, including in rural areas. The Commission also stated in its 2015 Communication on the circular economy^[10] that it will 'promote synergies with the circular economy when examining the sustainability of bioenergy under the Energy Union'. Finally, the EU and its Member States have committed themselves to meeting the 2030 Sustainable Development Goals.

[1] COM(2014) 15.

[2] COM/2015/080 final.

[3] Directive 2009/28/EC of the European Parliament and of the Council of 23 April 2009 on the promotion of the use of energy from renewable sources and amending and subsequently repealing Directives 2001/77/EC and 2003/30/EC (OJ L 140, 5.6.2009, p. 16).

[4] Directive 98/70/EC of the European Parliament and of the Council of 13 October 1998 relating to the quality of petrol and diesel fuels and amending Council Directive 93/12/EEC (OJ L 350, 28.12.1998, p. 58).

[5] Used for transport.

[6] Used for electricity, heating and cooling.

[7] Biomass production can take place on land that was previously used for other forms of agricultural production, such as growing food or feed. Since such production is still necessary, it may be (partly) displaced to land not previously used for crops, e.g. grassland and forests. This process is known as indirect land use change (ILUC); see <http://ec.europa.eu/energy/en/topics/renewable-energy/biofuels/land-use-change>.

[8] See more details on the existing sustainability framework for biofuels and bioliquids in section 5.

[9] COM/2010/0011 final.

[10] Closing the loop – an EU action plan for the circular economy (COM(2015) 614/2).

1. General information about respondents

★ 1.1. In what capacity are you completing this questionnaire?

- ☐ academic/research institution
- ☐ as an individual / private person
- ☒ civil society organisation
- ☐

- ☐ international organisation
- ☐ other
- ☐ private enterprise
- ☐ professional organisation
- ☐ public authority
- ☐ public enterprise

* 1.6. If you are a civil society organisation, please indicate your main area of focus.

- ☐ Agriculture
- ☐ Energy
- ☒ Environment & Climate
- ☐ Other
- ☐ Technology & Research

1.8. If replying as an individual/private person, please give your name; otherwise give the name of your organisation

200 character(s) maximum

Greenpeace

1.9. If your organisation is registered in the Transparency Register, please give your Register ID number.

(If your organisation/institution responds without being registered, the Commission will consider its input as that of an individual and will publish it as such.)

200 character(s) maximum

9832909575-41

1.10. Please give your country of residence/establishment

- ☐ Austria
- ☒ Belgium
- ☐ Bulgaria
- ☐ Croatia
- ☐ Cyprus
- ☐ Czech Republic
- ☐ Denmark
- ☐ Estonia
- ☐ Finland
- ☐ France
- ☐ Germany
- ☐ Greece
- ☐ Hungary
- ☐ Ireland

- ☐ Italy
- ☐ Latvia
- ☐ Lithuania
- ☐ Luxembourg
- ☐ Malta
- ☐ Netherlands
- ☐ Poland
- ☐ Portugal
- ☐ Romania
- ☐ Slovakia
- ☐ Slovenia
- ☐ Spain
- ☐ Sweden
- ☐ United Kingdom
- ☐ Other non-EU European country
- ☐ Other non-EU Asian country
- ☐ Other non-EU African country
- ☐ Other non-EU American country

* 1.11. Please indicate your preference for the publication of your response on the Commission's website:

(Please note that regardless the option chosen, your contribution may be subject to a request for access to documents under [Regulation 1049/2001](#) on public access to European Parliament, Council and Commission documents. In this case the request will be assessed against the conditions set out in the Regulation and in accordance with applicable [data protection rules](#).)

- ☒ Under the name given: I consent to publication of all information in my contribution and I declare that none of it is subject to copyright restrictions that prevent publication.
- ☐ Anonymously: I consent to publication of all information in my contribution and I declare that none of it is subject to copyright restrictions that prevent publication.
- ☐ Please keep my contribution confidential. (it will not be published, but will be used internally within the Commission)

Perceptions of bioenergy

2.1. Role of bioenergy in the achievement of EU 2030 climate and energy objectives

Please indicate which of the statements below best corresponds to your perception of the role of bioenergy in the renewable energy mix, in particular in view of the EU's 2030 climate and energy objectives:

- ☐ Bioenergy should continue to play a dominant role in the renewable energy mix.
- ☐ Bioenergy should continue to play an important role in the renewable energy mix, but the share of other renewable energy sources (such as solar, wind, hydro and geothermal) should increase significantly.
- ☒

Bioenergy should not play an important role in the renewable energy mix: other renewable energy sources should become dominant.

2.2. Perception of different types of bioenergy

Please indicate, for each type of bioenergy described below, which statement best corresponds to your perception of the need for public (EU, national, regional) policy intervention (tick one option in each line):

	Should be further promoted	Should be further promoted, but within limits	Should be neither promoted nor discouraged	Should be discouraged	No opinion
Biofuels from food crops	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>
Biofuels from energy crops (grass, short rotation coppice, etc.)	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>

Please specify the "other" choice

200 character(s) maximum

The above categories and source specifications, as well as the "important" in the introduction are too vague, making the table of answers only marginally relevant.

3. Benefits and opportunities from bioenergy

3.1. Benefits and opportunities from bioenergy

Bioenergy (biofuel for transport, biomass and biogas for heat and power) is currently promoted as it is considered to be contributing to the EU's renewable energy and climate objectives, and also having other potential benefits to the EU economy and society.

Please rate the contribution of bioenergy, as you see it, to the benefits listed below (one answer per line):

	of critical importance	important	neutral	negative	No opinion
Europe's energy security: safe, secure and affordable energy for European citizens	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>

Grid balancing including through storage of biomass (in an electricity system with a high proportion of electricity from intermittent renewables)					
Reduction of GHG emissions					
Environmental benefits (including biodiversity)					
Resource efficiency and waste management					
Boosting research and innovation in bio-based industries					
Competitiveness of European industry					
Growth and jobs, including in rural areas					
Sustainable development in developing countries					
Other					

3.2. Any additional views on the benefits and opportunities from bioenergy? Please explain

2500 character(s) maximum

Sustainable bioenergy has an important but small role to play in Europe's transition to an energy system based on renewable energy and energy efficiency. While the overall amounts of sustainable bio-energy are small, they might be the only means of decarbonising certain industrial processes or forms of transport (e.g. aviation), see the Greenpeace Energy Revolution scenario for 2050 for the applications with a remaining share of biomass use. (ref. <http://www.greenpeace.org/international/en/publications/Campaign-reports/Climate-Reports/Energy-Revolution-2015/>)

Currently, both the quantity (over-reliance on bio-energy) and the quality (not the right types of bio-energy are being promoted) of bioenergy used in the EU are problematic.

To avoid serious negative consequences for carbon emissions, biodiversity and land conflicts, the EU must introduce four main safeguards as part of the EU's 2030 climate and energy policies:

- An overall cap to limit the use of biomass for energy to levels that can be sustainably supplied;
- Provisions to ensure an efficient and optimal use of biomass resources, in line with the principle of cascading use;
- Verifiable significant life cycle greenhouse gas savings and correct carbon accounting for biomass;
- Comprehensive binding sustainability criteria.

Bioenergy production with co-benefits should be prioritised in comparison to biomass use only for energy. Examples include anaerobic digestion of waste-based biomass that allows to return nutrients to the soil and the use of biomass that is harvested for nature conservation purposes such as grassland management.

4. Risks from bioenergy production and use

4.1. Identification of risks

A number of risks have been identified (e.g. by certain scientists, stakeholders and studies) in relation to bioenergy production and use. These may concern specific biomass resources (agriculture, forest, waste), their origin (sourced in the EU or imported) or their end-uses (heat, electricity, transport).

Please rate the relevance of each of these risks as you see it (one answer per line):

	critical	significant	not very significant	non-existent	No opinion
Change in carbon stock due to deforestation and other direct land-use change in the EU	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Change in carbon stock due to deforestation and other direct land-use change in non-EU countries	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Indirect land-use change impacts	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
GHG emissions from the supply chain (e.g. cultivation, processing and transport)	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

GHG emissions from combustion of biomass ('biogenic emissions')	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Impacts on air quality	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Impacts on water and soil	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Impacts on biodiversity	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Varying degrees of efficiency of biomass conversion to energy	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Competition between different uses of biomass (energy, food, industrial uses) due to limited availability of land and feedstocks and/or subsidies for specific uses	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Internal market impact of divergent national sustainability schemes	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Other	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Please specify the "other" choice

200 character(s) maximum

Land-use conflicts, land grabs and human rights conflicts in and outside Europe. Additionally: wasteful use of limited biomass resources in contradiction with the concept of a circular economy.

4.2. Any additional views on the risks from bioenergy production and use? Please explain

2500 character(s) maximum

EU policies must address and mitigate the following main risks:

- Exceeding the available limits of sustainably sourced biomass, land and forest resources, avoiding at all times policy-driven demand for biomass energy on top of other, existing demands;
- Failure to reduce greenhouse gas emissions sufficiently, as a result of flawed default zero-rating for greenhouse gas emissions from bioenergy;
- Inefficient and wasteful use of biomass resources that is not in line with the cascading use principle and the circular economy.
- Negative environmental and social impacts, e.g. deterioration of air

quality, land use, loss of biodiversity, land right conflicts and land grabs.

It is a mistake to set mandates/targets for bioenergy use before sustainability can be guaranteed. This has been at the root of the biofuels problem and, amongst others, is driving UK biomass use.

The high risk of carbon emissions from bioenergy due to changes in natural carbon stocks are not just linked to deforestation or direct land-use change, as suggested by question 4.1. Risks are even bigger in relation to 1) time delay in the (assumed) recapture by biomass growth, and 2) decrease in carbon stocks because of increased harvesting for energy.

This consultation fails to appropriately consider negative social impacts, such as land-use conflicts, infringement of land rights, loss of livelihoods in local communities, volatility of food prices and food security. Yet they are of significant concern and high risk, especially in relation to land-based energy crops.

5. Effectiveness of existing EU sustainability scheme for biofuels and bioliquids

In 2009, the EU established a set of sustainability criteria for biofuels (used in transport) and bioliquids (used for electricity and heating). Only biofuels and bioliquids that comply with the criteria can receive government support or count towards national renewable energy targets. The main criteria are as follows:

- Biofuels produced in new installations must achieve GHG savings of at least 60 % in comparison with fossil fuels. In the case of installations that were in operation before 5 October 2015, biofuels must achieve a GHG emissions saving of at least 35 % until 31 December 2017 and at least 50 % from 1 January 2018. Lifecycle emissions taken into account when calculating GHG savings from biofuels include emissions from cultivation, processing, transport and direct land-use change;
- Biofuels cannot be grown in areas converted from land with previously (before 2008) high carbon stock, such as wetlands or forests;
- Biofuels cannot be produced from raw materials obtained from land with high biodiversity, such as primary forests or highly biodiverse grasslands.

In 2015, new rules^[1] came into force that amend the EU legislation on biofuel sustainability (i.e. the Renewable Energy Directive and the Fuel Quality Directive) with a view to reducing the risk of indirect land-use change, preparing the transition to advanced biofuels and supporting renewable electricity in transport. The amendments:

- limit to 7 % the proportion of biofuels from food crops that can be counted towards the 2020 renewable energy targets;
- set an indicative 0.5 % target for advanced biofuels as a reference for national targets to be set by EU countries in 2017;
- maintain the double-counting of advanced biofuels towards the 2020 target of 10 % renewable energy in transport and lay down a harmonised EU list of eligible feedstocks; and

- introduce stronger incentives for the use of renewable electricity in transport (by counting it more towards the 2020 target of 10 % renewable energy use in transport).

[1] Directive (EU) 2015/1513 of the European Parliament and of the Council of 9 September 2015 amending Directive 98/70/EC relating to the quality of petrol and diesel fuels and amending Directive 2009/28/EC on the promotion of the use of energy from renewable sources (OJ L 239, 15.9.2015, p. 1).

5.1. Effectiveness in addressing sustainability risks of biofuels and bioliquids

In your view, how effective has the existing EU sustainability scheme for biofuels and bioliquids been in addressing the risks listed below? (one answer per line)

	effective	partly effective	neutral	counter-productive	No opinion
GHG emissions from cultivation, processing and transport	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
GHG emissions from direct land-use change	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>
Indirect land-use change	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>
Impacts on biodiversity	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>
Impact on soil, air and water	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>

Any additional comments?

2500 character(s) maximum

The 2009 biofuels sustainability scheme ignored ILUC emissions and therefore did not prevent the deployment of biofuels with potentially higher GHG emissions than the fossil fuels they were meant to replace. This is counterproductive.

The 2015 revision of the scheme and the 7 per cent cap on food-based biofuels is expected to partly address ILUC impacts. However, it is still not sufficiently effective, as a) it does not include ILUC factors, b) it does not cover all land-based crops, c) it is not extended to the Fuel Quality Directive, and d) it still allows a growth in food-based biofuel use until 2020, because the 7 per cent cap is higher than current consumption levels.

While existing sustainability criteria have been partly effective in preventing direct land use change and other negative impacts. It is however

impossible to verify compliance for the sector as a whole with the existing criteria because of flawed verification systems.

Because of unclear or vague definitions of areas of e.g. primary forests, high biodiversity grasslands etc, the effectiveness of sustainability criteria on biodiversity (Art 17(3)) has been limited.

5.2. Effectiveness in promoting advanced biofuels

In your view, how effective has the sustainability framework for biofuels, including its provisions on indirect land-use change, been in driving the development of 'advanced' biofuels, in particular biofuels produced from ligno-cellulosic material (e.g. grass or straw) or from waste material (e.g. waste vegetable oils)?

- ☐ very effective
- ☐ effective
- ☒ neutral
- ☐ counter-productive
- ☐ no opinion

What additional measures could be taken to further improve the effectiveness in promoting advanced biofuels?

2500 character(s) maximum

Land-based biofuels must be completely phased out after 2020. Advanced, non-land-based biofuels may play a role in the phase-out of land-based biofuels, provided the EU prioritises other measures to decarbonise the transport sector (e.g. demand reduction, vehicle performance standards, renewable hydrogen and electrification).

There should be no volume / percentage target for advanced (or any other) biofuels as this approach wrongly focuses on quantity and not quality and impacts of those biofuels.

The same sustainability requirements must apply to all bioenergy, including advanced biofuels, not least to ensure a level playing field. (see response 8.2) and provide a consistent and more secure policy framework for investments.

5.3. Effectiveness in minimising the administrative burden on operators

In your view, how effective has the EU biofuel sustainability policy been in reducing the administrative burden on operators placing biofuels on the internal market by harmonising sustainability requirements in the Member States (as compared with a situation where these matter would be regulated by national schemes for biofuel sustainability)?

- ☐ very effective

- ☒ effective
- ☐ not effective
- ☐ no opinion

What are the lessons to be learned from implementation of the EU sustainability criteria for biofuels? What additional measures could be taken to reduce the administrative burden further?

2500 character(s) maximum

The EU should address all concerns in relation to negative societal, climate and environmental impacts, raised by the scientific community and civil society, by applying the precautionary principle to avoid flawed or constantly changing policy incentives.

In order to harmonise its approach in favour of sustainability and to give clear public incentives, the EU should set in place a robust, coherent and binding EU level policy for all forms of bioenergy (biofuels, solid and gaseous bioenergy).

Sustainability policies must go beyond regulating land and forest management practices. They must address natural resource use and the ecological footprint, resource efficiency, full carbon emission impacts, social issues and overall volume of the demand that is created.

The Commission must introduce robust transparency requirements for the approval of different sustainability verification schemes.

5.4. Deployment of innovative technologies

In your view, what is needed to facilitate faster development and deployment of innovative technologies in the area of bioenergy? What are the lessons to be learned from the existing support mechanisms for innovative low-carbon technologies relating to bioenergy?

2500 character(s) maximum

The new policy must give clear preference to bioenergy (biomass source, conversion technologies etc.) that delivers societal and environmental benefits, and must explicitly exclude bioenergy with proven negative impacts, so as to incentivise the development of more innovative uses and forms of bioenergy.

The EU should promote technological innovation through stringent requirements for higher conversion efficiency.

The EU should omit targets and volume mandates for biofuel and bioenergy, as they promote quantity over the effective, innovative or environmentally beneficial use of bioenergy.

6. Effectiveness of existing EU policies in addressing solid and gaseous biomass sustainability issues

6.1. In addition to the non-binding criteria proposed by the Commission in 2010, a number of other EU policies can contribute to the sustainability of solid and gaseous bioenergy in the EU. These include measures in the areas of energy, climate, environment and agriculture.

In your view, how effective are current EU policies in addressing the following risks of negative environmental impacts associated with solid and gaseous biomass used for heat and power? (one answer per line)

	effective	partly effective	neutral	counter-productive	No opinion

Other: social impacts such a land-use rights, human rights and food security.

6.2. Any additional views on the effectiveness of existing EU policies on solid and gaseous biomass?
Please explain

2500 character(s) maximum

EU agricultural policies such as the Common Agricultural Policy and rural development, and national legislation on sustainable forest management and waste management have not been effective in limiting the use of biomass for energy or ensuring its sustainability. Greenpeace therefore calls for binding EU sustainability requirements on energy producers.

Similarly, emission reporting rules for the LULUCF sector under the Kyoto Protocol have also been ineffective in capturing the emissions of increased bioenergy use, and therefore have failed to deter high-carbon bioenergy sources or effectively reduce carbon emission.

EU and national legislation to ensure that bioenergy use delivers true GHG savings and that biomass is used in a resource-efficient way, in line with the cascading use principle, is urgently needed. It will not be enough to merely rely on the introduction of sustainability requirements for agriculture or forestry sectors. The EU ETS erroneously assumes all bioenergy emissions to be zero without any requirements to prove that emission savings actually take place. To avoid misguided policies, all EU climate and energy policies must be aligned with regards to bioenergy sustainability requirements.

7. Policy objectives for a post-2020 bioenergy sustainability policy

7.1. In your view, what should be the key objectives of an improved EU bioenergy sustainability policy post-2020? Please rank the following objectives in order of importance: most important first; least important 9th/10th (you can rank fewer than 9/10 objectives):

Please specify the "other" choice

200 character(s) maximum

Avoid negative social impacts, notably on food security, land and human rights and avoid land grabs.

7.2. Any other views? Please specify

2500 character(s) maximum

The EU biomass sustainability policy should direct the limited amount of available sustainable biomass to those applications with the highest conversion efficiency or where there is no renewable alternative option. Heating is the most energy efficient application for biomass, especially when used in district heating systems, and biomass heating can be a valid solution for buildings where a conversion to efficient heat pumps and solar thermal is not feasible or sufficient. For industrial high temperature process heat, biomass or biogas may be the most accessible renewable option. The renewable energy directive should direct bioenergy to applications with an energy conversion efficiency that exceeds a threshold that is to be defined, or which lack feasible renewable alternatives. In addition the EU must adopt a robust bioenergy sustainability policy in combination with clear air emission limits.

Bioenergy use must contribute to climate change mitigation, the circular economy and resource efficiency without negative impacts on the environment, land use and human rights. Yet, in all these areas evidence of negative impacts already exists. If the EU neglects any of these policy objectives, it will undermine its future sustainability policy; de-prioritising any of these first four objectives is counterproductive.

The extent and scale of the negative impacts depends equally on the quality and quantity of biomass use. Studies have shown that the EU is already starting to reach the limits of wood and land resources available for the various growing needs of different sectors, including policy-driven energy demand. The EU should urgently evaluate the sustainable potential of domestic biomass supply for energy use, taking into consideration competing uses in other sectors and environmental protection. It should cap the use of biomass for energy accordingly.

8. EU action on sustainability of bioenergy

8.1. In your view, is there a need for additional EU policy on bioenergy sustainability?

- ☐ No: the current policy framework (including the sustainability scheme for biofuels and bioliquids, and other EU and national policies covering solid and gaseous biomass) is sufficient.
- ☐ Yes: additional policy is needed for solid and gaseous biomass, but for biofuels and bioliquids the existing scheme is sufficient.
- ☐

Yes: additional policy is needed on biofuels and bioliquids, but for solid and gaseous biomass existing EU and national policies are sufficient.

- Yes: a new policy is needed covering all types of bioenergy.

8.2. In your view, and given your answers to the previous questions, what should the EU policy framework on the sustainability of bioenergy include? Please be specific

5000 character(s) maximum

The EU must introduce four main safeguards for bioenergy use as part of the EU's 2030 climate and energy policies:

- An overall cap to limit the use of biomass for energy production to levels that can be sustainably supplied;
- Provisions to ensure an efficient and optimal use of biomass resources, in line with the principle of cascading use;
- Verifiable significant life cycle greenhouse gas savings and correct carbon accounting for biomass;
- Comprehensive binding sustainability criteria to ensure positive social and environmental impacts.

Concretely, the policy should result in the exclusion of those kinds of biomass sources that have the highest risk of negative climate and environmental impacts and support only the use of lower risk sources such as waste and residue-based biomass, while still respecting the principle of cascading use.

9. Additional contribution

Do you have other specific views that could not be expressed in the context of your replies to the above questions?

5000 character(s) maximum

Policies on agriculture and sustainable forest management have failed to stop biodiversity decline in relevant habitats and bioenergy use with negative impacts on the environment and climate. While these policies should be improved, additional legislation for the energy sector is needed to ensure in particular that GHG savings from bioenergy use are delivered and that biomass resources are used in an efficient way.

Policies for emissions from land use, land use change and forestry (LULUCF) sector, such as the EU's LULUCF Decision and the Kyoto Protocol, have failed to effectively capture or limit the biogenic emissions related to bioenergy use. Today's accounting rules and targets for the land sector are inconsistent and allow the hiding of emissions in projected reference levels (in forest management especially). Carbon emissions must to be minimised by applying sustainability requirements on the policies driving bioenergy use, notably the renewable energy policies. As operators in the energy sector benefit from support schemes on renewable energy, they must be held responsible for

ensuring that emissions savings are actually delivered.

Last, but certainly not least, the EU should always apply the 'efficiency first' principle and should reduce energy demand where possible to promote the transition towards a 100% renewable-based energy system.

Finally, you may upload here any relevant documents, e.g. position papers, that you would like the European Commission to be aware of.

Thank you for participation to the consultation!
