About CIEP

CIEP contributes to the public debate on international political and economic developments in the energy sector (oil, gas and electricity) and energy-related climate change issues and energy transition. CIEP contributions include research, events, publications, comments, lectures and training.

History

In September 2001, the Clingendael International Energy Programme (CIEP) was launched, supported by twelve institutions from the public and private sectors for a project period of four years under the Stichting Fonds Institute CIEP (SFIC). Since then, CIEP was continued in 2004, 2008, 2012, 2016 and 2021, each time for four years. The current project period runs from 2021-end 2024. CIEP is supported by 20+ public and private institutions and companies.

Research and activities

CIEP's current research and activities revolve around the issues of the geo-political and geo-economic consequences of changing supply and demand patterns in energy, in particular oil and natural gas and renewable energy carriers, and the development of European energy markets and energy policy-making against the background of international energy market developments and energy transition.

Energy Training and Education

CIEP offers on-demand training modules covering a wide range of international energy issues, customised to particular needs and interests.

An independent forum

The Centre for International Energy Policy CIEP acts as an independent forum for governments, non-governmental organizations, the private sector, the media, politicians and others who are interested in changes and developments in the energy sector.
